

Useful Tips

3 main ways to export data

1. Create map -> right-click on map -> Select Export
2. Right-click on item in management tree -> Select Export
3. Batch Export (Advanced Only)

You can choose what gets exported by selecting the specific attributes and properties contained within the spatial file.

If you wish to export data out in a different format from the default setting, first change your map to reflect the desired look then proceed to export.

If exporting to KML/KMZ formats, management items such as Field or hybrid names cannot be exported out

- To work around this, you can add a custom attribute to the data grid of your dataset and export that attribute

Common Issues

If you change the map type to an alternative map type and export out, only the mapped attribute will be exported.

In order to export out all attributes, save your changes as an operational default
